

ELIMINATE BACTERIA & ODOR FROM YOUR EQUIPMENT HOW? SANI SPORT

(Available now Gear On Ice - pro shop in Fox Valley Ice Arena)
Any questions call (630) 232-1788

Where the Problem comes from:

Perspiration from strenuous activity allows bacteria to develop deep within sports equipment. The result is potentially dangerous contact with the athlete's skin, and the familiar odors associated with hockey, football, and other sports equipment. NHL stars, such as Joe Thorton (Bruins), Ed Belfour and Mikael Renberg (Maple Leafs), and Darren McCarty (Red Wings) have all lost playing time this season due to bacterial infections caused by open sores becoming infected by the bacteria in their equipment.

The Solution.....

Canadian university researchers developed the Sani Sports equipment sanitizing system. The system was designed to destroy the bacteria in sports equipment, recognizing that if you can destroy the bacteria, the odors will be eliminated. Introduced in October, 2002, there are currently 45 systems, 15 in the United States, currently in use. This includes three systems being used by three NHL teams (Buffalo, Ottawa and Vancouver).

The Way it Works.....

Four high-intensity UV lights convert Oxygen into Ozone. The ozone is then circulated throughout the equipment by two complimenting fans for twelve minutes, killing up to 96% of the bacteria present. A patented Ecomist solution, containing natural Tea Tree Oil, is then fogged deep into the equipment to attack the remaining bacteria. The final step is to seal the process with a scented bactericide creating a protective shield on the equipment.

What You Need to Know.....

This is not another fragrance or scented cover-up, but a scientific, biological process designed to eliminate bacteria and the resulting odors from sports equipment. The residual ozone left in the equipment has a scent that is slightly medicinal, but not unpleasant.

The Sani Sport takes approximately 15 minutes in processing time, and will be performed on a first come, first serve basis. Equipment is ready to use immediately upon completion of the process.

There is no way to determine how long the treatment will last with each individual. Factors such as amount of equipment use and individual perspiration will determine the frequency with which you would need to sanitize. Skates and gloves are more difficult to treat. Players will still need to air dry their equipment after it is used to extend the effectiveness of the Sani Sport process.
